

Proposed Solution

Date	5 January 2026
Team ID	LTVIP2026TMIDS80392
Project Name	Heart Disease Analysis
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Heart diseases are one of the leading causes of death worldwide. Early detection is difficult because symptoms may appear late, and manual analysis of medical data can be time-consuming and error-prone. There is a need for a reliable system that can analyze heart-related data and assist in early diagnosis.
2.	Idea / Solution description	The proposed solution is an intelligent heart analysis system that uses patient medical data such as ECG results, blood pressure, cholesterol levels, age, and other health parameters to predict the risk of heart disease. The system applies machine learning techniques to analyze data quickly and provide accurate predictions, helping doctors in decision-making.
3.	Novelty / Uniqueness	The uniqueness of this solution lies in combining multiple health parameters into a single predictive model that provides fast and data-driven insights. It reduces human error, supports early risk prediction, and offers an easy-to-use interface for both healthcare professionals and patients.
4.	Social Impact / Customer Satisfaction	This solution helps in early detection of heart problems, which can save lives and reduce healthcare costs. Patients gain awareness about their heart health, while doctors receive reliable analytical support, leading to better treatment outcomes and higher satisfaction.
5.	Business Model (Revenue Model)	The system can generate revenue through hospital subscriptions, diagnostic center licensing, and healthcare partnerships. Additional income can be generated through premium analytics features, cloud-based

		access, and maintenance services for healthcare institutions.
6.	Scalability of the Solution	The solution can be easily scaled by integrating with hospitals, clinics, and telemedicine platforms. It can handle large datasets and be expanded to include wearable device data, enabling real-time heart monitoring and wider adoption across different regions.
