**Model Performance Testing:**

Project team shall fill the following information in model performance testing template.

| S.No. | Parameter               | Screenshot / Values                                                                                                                                                                                                                                                    |
|-------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Data Rendered           | The dashboard successfully renders heart disease data without noticeable delay. The dataset includes Age Category, Gender, BMI, Smoking, Alcohol, Diabetes, Stroke, General Health, and Heart disease fields. All visualizations load within acceptable response time. |
| 2.    | Data Preprocessing      | Data was cleaned before visualization. Categorical variables were validated, BMI bins were created for histogram analysis, and null values were verified and handled appropriately. Data types were formatted correctly.                                               |
| 3.    | Utilization of Filters  | Interactive filters such as Age Category, Gender, BMI (bin), Smoking, and Diabetes were implemented. "Use as Filter" functionality enables cross-sheet interaction. Dashboard updates dynamically when filters are applied.                                            |
| 4.    | Calculation fields Used | Calculated fields such as COUNT of patients, percentage of heart disease cases, BMI bin grouping, and category-based aggregations were implemented to enhance analytical insights.                                                                                     |
| 5.    | Dashboard design        | Number of Visualizations / Graphs – 10 (Bar Charts, Histogram, Percentage Distribution, Comparative Analysis, KPI Overview). Layout is structured, organized, and responsive.                                                                                          |
| 6     | Story Design            | Story points are arranged logically to explain heart disease trends, comparisons, risk factors, and key insights step by step, ensuring clarity and analytical flow.                                                                                                   |
